Utah Water Supply Outlook

June 1, 1986

Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are termed reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. Because of the limited space, snow survey measurements are not published in monthly reports. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado (New Mexico)	2490 West 26th Ave., Denver, CO 80211
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715
Nevada	50 South Virginia Street, Third Floor, Reno, NV 89505
Oregon	1220 Southwest 3rd Ave., 16th Floor, Portland, OR 97204
Utah	4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147
Washington	360 U.S. Court House, Spokane, WA 99201
Wyoming	Federal Building, 100 East "B" Street, Casper, WY 82602

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 547, Portland, OR 97209.

- 7 E. GARFIELD, KANE, WASHINGTON, & IRON CO.

GENERAL OUTLOOK

SUMMARY:

Early May storms contributed more to the already heavy snowpacks on northern Utah watersheds and were responsible for bringing the Great Salt Lake to its historical peak of 4211.6 feet by mid-month. By month's end the Lake had set a new record elevation of 4211.8 feet with the new peak forecast set at 4212.0 feet. In contrast, sharp withdrawals of stored water in southwestern Utah reservoirs and extremely low streamflows are going to mean a shortened growing season.

SNOWPACK:

Snowpack across Utah varies from much above average in the north to almost melted in the south. The Bear, Weber and Provo River watersheds have from 50 to 70% more water in their snowpack than is normal for June 1. The Uintas have about 25% more snow water than normal. Southern Utah is quite a different story. Only a handful of snow courses at the highest elevations on the Lower Sevier and San Rafael River watersheds still have snow. The Beaver River watershed is still the exception in southern Utah with 160% normal snowpack for June 1.

PRECIPITATION:

Mountain precipitation varied widely across Utah. The Bear and Weber River watersheds had another month of above normal precipitation (the fifth and fourth month respectively). Mountain areas on the Lower Sevier and in extreme southern and southeastern Utah also had above normal precipitation. The central Uinta Mountain area received near normal precipitation. Mountain areas in the remainder of Utah had below normal rainfall in May. Seasonal precipitation accumulation (October-May) is greater than normal over the mountain areas of the entire state.

RESERVOIRS:

Storage of usable water in 23 key irrigation reservoirs in Utah is 93% of capacity and 120% of average for June 1. Deer Creek, Rockport and Echo reservoir have been held down in anticipation of high snowmelt runoff and are filling rapidly. Reservoirs in Washington County are being depleted rapidly and shortages are likely by August.

STREAMFLOW:

Forecasts on some of the streams that feed into the Great Salt Lake have increased from the levels forecast on May 1 due to heavy early May precipitation. Forecasts over the rest of the state are generally unchanged from last month. Forecasts range from 81% to 481% of normal across the state. High water is being experienced on the Weber and Provo with some localized flooding being reported and available storage in reservoirs being filled rapidly.

*Letin represent cooperative efforts of the Soil
tional Weather Service in an effort to provide
ter users and managers.*

Bear River Basin

Mountain snowpack* (inches)

*Based on selected stations

Maximum  Average 
 Minimum  Current 

Precipitation* (percent of normal)

*Based on selected stations

Monthly precipitation  Year to date precipitation 

WATER SUPPLY OUTLOOK:

Snowpack on the Bear River drainage is approximately one and one-half times normal for June 1. Logan River snowpack is also more than 50% greater than average. May precipitation at mountain stations was 153% of average (the fifth consecutive month of above normal precipitation). Reservoir storage is 95% of capacity and 119% of average. Streamflow forecasts are unchanged from last month ranging from 118% to 204% of average.

Precipitation* (percent of normal)

*Based on selected stations

Monthly precipitation  Year to date precipitation 

WATER SUPPLY OUTLOOK:

Snowpack on the Weber River drainage is nearly 70% above average for June 1. Ogden River snowpack is 56% greater than normal. Mountain precipitation for the fourth consecutive month was greater than normal with May precipitation at 140% of average. Reservoirs are storing 90% of capacity and 100% of average for the first of June. Forecasts of May through June streamflow are higher than the May 1 forecasts due to the heavy early May precipitation. Forecasts range from 161 to 248% of average.

WATER SUPPLY OUTLOOK:

Snowpack on the watershed which drains into Utah Lake is nearly 50% greater than average. Provo River snowpack contains almost 60% more water than is normal for the first of June. Precipitation at mountain stations was generally below average during May with the exception of Trial Lake which received 121% of average. Reservoir storage is 79% of capacity and 87% of average with Deer Creek being held down. Heavy early May precipitation increased some forecasts. Forecasts range from 92 to 241%.

WATER SUPPLY OUTLOOK:

Snowpack on the snow courses of southeastern Utah has been nearly depleted by melt with the exception of a few of the highest sites on the tributaries to the San Rafael. Near normal precipitation was the rule during May with mountain stations average 98% of normal for the month. Reservoir storage is 96% of capacity and 107% of average. Streamflow forecasts are the same as forecast a month ago. Forecasts range from 91 to 192% of average.

WATER SUPPLY OUTLOOK:

All snow courses in southwestern Utah are bare. Mountain precipitation during May varied widely ranging from less than half of normal at Tall Poles in Parowan Canyon to 25% above normal at Little Grassy Creek above Enterprise. Reservoir storage is only 64% of capacity and, with heavy withdrawals being made, the irrigation season will likely be cut short due to water shortages without some rainfall relief. Coal Ck., Santa Clara, and Virgin R. forecasts are unchanged. Inflow to L. Powell increased.

Utah Snowpack Progress

Statewide

Average monthly snow water equivalent for the current water year is compared to 1961-80, 20 year average monthly snow water equivalent. Peak average snow water equivalent achieved on April 1 equals 100%.

The Following Organizations Cooperate With The Soil Conservation Service In Snow Survey Work

State

Utah State University
Utah State Department of Natural Resources
Division of Wildlife Resources
Division of Water Resources
Division of Water Rights
Bear River Commissioner
Price River Commissioner
Provo River Commissioner
Sevier River Commissioners
Spanish Fork River Commissioner
Utah Lake and Jordan River Commissioner

Federal

U.S. Department of Agriculture
Soil Conservation Service
Forest Service
U.S. Department of Commerce
NOAA, National Weather Service
U.S. Department of Interior
Bureau of Reclamation
Geological Survey
National Park Service

Municipality

Manti
Salt Lake City

Public

Beaver River Water Users Association
Board of Canal Presidents - Jordan River
Central Utah Conservancy District
Emery Canal and Reservoir Company
Moon Lake Water Users Association
Ogden River Water Users Association
Provo River Water Users Association
Strawberry Water Users Association
Sevier River Water Users Association
Weber River Water Users Association
Weber Basin Conservancy District

Other organizations and individuals furnish
